

**Table 1S.** Coefficients (r) and significance level for the correlations between the determined traits [BpP: branches per plant, PH: plant height, PpP: pods per plant, SpP: seeds per pod, HSW: 100-seed weight, SY: seed yield per plant, HI: harvest index,  $L^*$ ,  $a^*$ ,  $b^*$ : testa color parameters, Prot: seed protein concentration, SPC: seed protein content, TPhe: total phenolic compounds, TTan: total tannins, BD: percentage of bruchid holes, PD: percentage of parasitoid holes, and BI: bruchid-infestation level (BI = BD + PD)] in 10 *Vicia faba* accessions tested across two years (n = 10).
