## ABSTRACT

E-learning is emerging as the new paradigm of modern education. Most of the e-learning systems have limitations such as scarcity of content, lack of intelligent search and context sensitive personalization problems, which are the challenging tasks for researchers. This motivated the author to take up this problem and the method implemented through this work suggests the instructors to use the combination of E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) was designed. The main aim of the model developed is to get consistency in content delivery, quality content in learning materials, students self-learning concept, and performance improvement in their examination. A study has been conducted During June 2013 to September 2013, the author collected samples of 1631 from final year and Second year of BCA, B.SC and B.Sc-IT students were trained through e-learning system architecture and the objectives of this study is 1. To measure the effectiveness of E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) among the students of Mercury College of arts and science And Sankara arts and Science College in concepts of Programming in JAVA Course. The newly designed E-learning System using Rank-Based Clustering Algorithm (EUSRBCA) shows an improvement over the existing systems with better results. From the various evaluations carried out, the performance of the system found to be good comparatively to other systems in e-learning domain.

## 1. INTRODUCTION

The concept of e-learning is expected to develop as technology advances. In order to boost the gains of e-learning market, the learning components are developed [16] that interoperate and co-operate. The great advantages of e-Learning include liberating interactions between learners and instructors, or learners and learners, from limitations of time and space through the asynchronous and synchronous learning networks.

## 2. RELATED WORK OF E-LEARNING

This section presents a literature survey of the approaches used in e-learning environments. [15] Describes learning styles as the preferred ways through which learners interact with and process information in learning environments. Different views of learning styles were and are still discussed in the literature. Behaviorism, a reductionist view of human behavior, dominated the field in the first half of the 20th century. It was called reductionist because it used a black box approach based on empiricism, but such a simplified view left much to be desired. Rogers points out that "learning includes goals, purposes, intentions, choice and decision-making, and it is not at all clear where these elements fit into the learning cycle" [12]. online learning has advantages over traditional face-to-face education [8], concerns include time, labor intensiveness, and material resources involved in running e-Learning environments. The costly high failure rate of e-

Learning implementations discussed by [2] deserves attention from management and system designers.

**Table 1.1 Comparative study of existing Data mining based e-learning methods**

| Learning System   | Theory Basis  | Instructional Emphasis   | Results   |
|---|---|--|---|
| Data Mining In The E-Learning Domain (Developed By Margo Hanna In 2004).  | Awareness of the knowledge economy has come a growing consciousness that HE (Higher Education) a large industry or economic sector.                         | Agent based approaches have software systems that perform the content mining. Search engines belong to this class as do intelligent search engines, information filtering and personalized web agents. | Online events are becoming a promising area for research and development when the business in education is growing impressively.          |
| Predicting Relationship Between Online Questions Theme And Final Grade (Developed By Abdous, M., W., &yen, C.-J in 2012). | EDM (Educational Data Mining) And regression analysis to analyze Live Video stream (LVS) students online learning behaviours And their performance in their | Focused on understanding Live video Streaming (LVS) students learning behaviours, their interaction and their learning outcomes.   | Students learning behaviours, ranging from active participation and interaction with the instructor to a lack of participation or even of |

### 3. ARCHITECTURE OF E-LEARNING SYSTEM

In this work, architecture of e-Learning the combination of E-learning System Using Rank-Based Clustering Algorithm (ESURBCA). The Rank-Based Clustering Algorithm is capable of retrieving computer application based databases from the www and they are clustered based on the relativeness of the document to the user search. Clustering is based on page ranking which represents the level of relativeness for the retrieved clustered documents. Document retrieval is based on the occurrence of the computer application based terminologies and keywords based on the user search text.

**Fig 1.1 Architecture of E-Learning System using Rank-Based Clustering Algorithm**

The below is the algorithm for Rank-Based Clustering Algorithm used in the Architecture of e-learning system

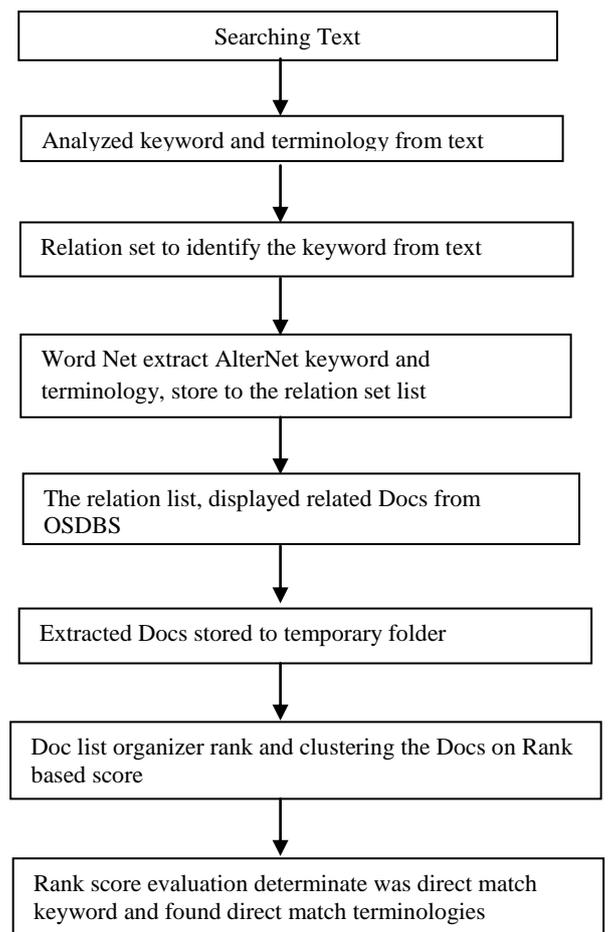

- Step1: Enter the searching text
- Step2: Analyzed keyword and terminology from text
- Step3: The relation set to identify the keyword from text
- Step4: Through Word Net extract AlterNet keyword and terminology, store to the relation set list
- Step5: The relation list, displayed related Docs from OSDBS
- Step6: Extracted Docs stored to temporary folder
- Step7: Doc list organizer rank and clustering the Docs on Rank based score
- Step8: Rank score evaluation determinate was direct match keyword and found direct match terminologies.

### 4. PERFORMANCE EVALUATION OF E-LEARNING

Data mining-based e-learning system environment combined the pedagogical, communication and software tools integrated into one system that is used to promote learning. This helps to create an optimal knowledge building and learning environment for students.

A study has been conducted to measure the effectiveness of e-learning system using Rank-Based Clustering Algorithm among the students of Mercury College of arts and science And Sankara arts and Science College in concepts of Java programming course.

The purpose of the study was twofold: (i) to measure the effectiveness of E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) (ii) To find the student effectiveness (test mark) of E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) among the students of Mercury College of arts and science And Sankara arts and Science College in concepts of Java programming course based on their marks before and after the e-learning course. This paper presents how the collected data are analyzed through appropriate statistical techniques and the results of data analysis.

**Fig 1.2 Rank-Based Clustering Algorithm**

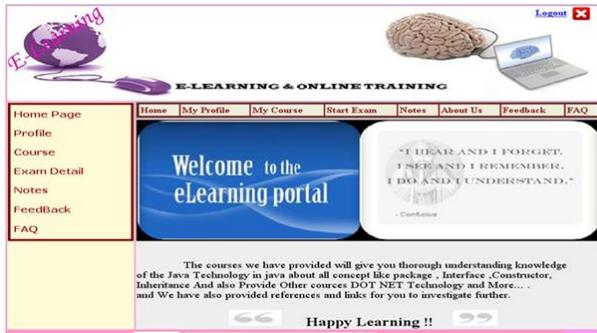

Fig 1.3 Implementing the Architecture of E-Learning System for Java Programming

### 4.1 Performs Validation of E-learning system

To find the student effectiveness (test mark) of To measure the effectiveness of E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) among the students of Mercury College of arts and science And Sankara arts and Science College in concepts of Programming in JAVA Course based on their marks before and after the e-learning course during June 2013 to September 2013, the author collected samples of 1631 from final year and Second year of BCA,B.SC and B.Sc-IT students trained through e-learning system architecture.

### 4.2 Hypothesis Tested

#### 4.2.1 Research Hypothesis (H1)

There will be a significant difference in the opinion and preferences of students between the traditional teaching method (TTM) and E-learning System Using Rank-Based Clustering Algorithm Null Hypothesis (Ho) there will not be a significant difference in the opinion and preferences of students between the traditional teaching method (TTM) and E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) based on factors.

Normally ANOVA test requires the independent and dependent variables to test the significance. It is further classified into one-way and multi [MANOVA] analysis. The table 1.3 shows the significant difference in the opinion and

preferences of students between the traditional teaching method (TTM) and E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) based on factors (ESURBCA) based on factors.

Based Clustering Algorithm (ESURBCA), among the learners, in the following factors (Fig 1.3), Feedback about the performance in the course, The instructors interest in your learning, The instructors assessment of your progress in the course Utilization of class time, The instructors overall organization of the course, Continuity from one class meeting to the next meeting, Learning materials used in the courses, Availability to assist students in or outside of class was, Simulation of interest in the course was and Facilitation of learning , are in favour of E-learning System Using Rank-Based Clustering Algorithm (ESURBCA) method at the level of significance of 0.05.

**Table 1.4 Mean Values**

| S.NO | FACTORS  | TTM   | ESURBCA |
|------|--|-------|---------|
| 1    | Feedback about the performance in the course               | 2.127 | 2.407   |
| 2    | The instructors interest in your learning                  | 2.16  | 2.395   |
| 3    | Utilization of class time                                  | 2.085 | 2.428   |
| 4    | The instructors overall organization of the course         | 2.197 | 2.41    |
| 5    | Continuity from one class meeting to the next meeting      | 2.09  | 2.416   |
| 6    | The instructors assessment of your progress in the course  | 2.081 | 2.405   |
| 7    | Learning materials used in the courses                     | 2.143 | 2.408   |
| 8    | Availability to assist students in or outside of class was | 2.104 | 2.422   |
| 9    | Simulation of interest in the course was                   | 2.143 | 2.406   |
| 10   | Facilitation of learning was                               | 2.223 | 2.418   |

Depending on the Feedback about the performance in the course, among the traditional teaching method (TTM) and E-learning System Using Rank-Based Clustering Algorithm (ESURBCA), there is significant difference exist among the learners. It is proved through the table 1.3 that significance is 0.001 which is less than 0.05. So the Null Hypothesis is rejected.

There is a significant difference between the traditional teaching method (TTM) and E-learning System Using Rank-

## 5. CONCLUSION

The concepts of e-learning system have been outlined. E-learning is considered in the context of formally and systematically organized teaching and learning activities, in which the instructor and the learner(s) use ICT to facilitate their interaction and collaboration. The use of data mining based e-learning system will definitely impact the quality of the education that is delivered and the deliverability of information through knowledge and information sharing. The newly designed E-learning System using Rank-Based Clustering Algorithm (EUSRBCA) shows an improvement over the existing systems with better results. From the various evaluations carried out, the performance of the system found to be good comparatively to other systems in e-learning domain.
