The Effects of Marital Status, Fertility, and Bereavement on Adult Mortality in Polygamous and Monogamous Households: Evidence From the Utah Population Database

Kieron J. Barclay, Robyn Donrovich Thorén, Heidi A. Hanson, and Ken R. Smith

FIGURE S1. Multivariate estimates of mortality hazard for women: interaction between whether husband was a farmer and marital status of women. Error bars are 95% confidence intervals. Note that the estimates shown in the left and right panel are from the same model, where the common reference category is women in first monogamous marriages who have not been widowed. Estimates are based upon Model 4.

FIGURE S2. Interaction between marriage order of women in polygamous marriages and husband mortality, by marriage group size, applying husband fixed effects. Error bars are 95% confidence intervals. Each panel represents a separate analysis by completed marriage group size.

FIGURE S3. Multivariate estimates of mortality hazard for men: interaction between whether man was a farmer and marital status of men. Error bars are 95% confidence intervals. Note that the estimates shown in the left and right panel are from the same model, where the common reference category is men in first monogamous marriages who have not been widowed. Estimates are based on Model 12.
